

Artemisia genipi

Artemisia genipi Weber, 1775

The black genepi can grow up to 15 cm in height. Silky hair gives the plant a greyish appearance.

The leaves of its stem are divided into a comb shape (with or without teeth!).

Its yellow flowers are grouped in capitula, *mostly in the upper part of the stem*. The bracts surrounding these inflorescences are edged in black.

Not to confuse

The black genepi is distinguished from other genepi by the shape of the leaves on the stem and the blackish colour of the edges of the flower heads.

Common names

Artemisia genipi

Environment

High altitude rocky ridges & Scree & Moraines

Altitude

2200 - 3500 m

Season

- june - september

Size

5 to 15 cm
